

RAMIT HANSDA

ENGINEERING MANAGER — BACKEND (HANDS-ON)

ramit.ju.cse@gmail.com | +91 9632155404 | Bangalore, Karnataka, India | [linkedin.com/in/ramit-hansda](https://www.linkedin.com/in/ramit-hansda)

PROFILE

Hands-on Engineering Manager with 10+ years building and scaling backend systems, and 4+ years leading small, product-aligned squads in fintech and financial services. Comfortable moving between architecture discussions, pull request reviews, and 1:1s — staying technically active rather than managing from a distance. Deep expertise in distributed systems, payments infrastructure, and backend architecture at scale, including microservices, Kafka-based event pipelines, and multi-cloud environments. Early and hands-on with agentic AI and LLM-powered tooling — from building production agentic systems to driving AI-assisted development adoption across engineering teams. Experienced leading and building trust across distributed, cross-timezone teams (US, EU/UK). Polyglot backend engineer (Java, Python, Node.js/TypeScript) who ramps quickly on new stacks and cares deeply about clean, maintainable code.

PROFESSIONAL EXPERIENCE

Engineering Manager & Founding Engineer · [Skydo](#)

07/2022 – 03/2026

HANDS-ON LEADERSHIP & SQUAD OWNERSHIP

- Led and mentored a 12-engineer cross-functional squad (backend, frontend, platform, AI) as a founding engineer — staying hands-on in code reviews, architecture decisions, and complex feature development while owning hiring, performance management, and delivery.
- Partnered directly with product and leadership to translate roadmap priorities into technical plans with realistic timelines; owned retrospectives and continuous-improvement initiatives to unblock the team and raise delivery velocity.
- Championed engineering best practices — testing, observability, security, and clean code — raising the technical bar across the org.
- Collaborated daily with distributed teams and stakeholders across US and EU/UK timezones, building trust and async communication habits across a fully remote, cross-timezone org.
- Mentored engineers in distributed systems, scalability, and architectural decision-making.

AI-AUGMENTED ENGINEERING

- Identified and introduced AI-augmented workflows to accelerate delivery and reduce toil: defined org-wide standards and best practices for agentic coding tools (Claude, Cursor, Windsurf) across engineering.
- Designed and shipped an Agentic Support Copilot (hybrid RAG + tool-calling, human-in-the-loop) with compliance guardrails — achieving 65% auto-triage and 35–40% auto/assisted resolution, cutting first-response time from 90 min to 10 min and SLA breaches by 50%.

BACKEND ARCHITECTURE AT SCALE

- Owned the technical architecture of a core payments and settlement platform processing 10K+ international transactions/day, with strong guarantees on idempotency, reconciliation, and failure recovery.
 - Architected distributed job scheduling and async workflow orchestration across multi-cloud environments; implemented distributed locking and rule-based decisioning for safe concurrent financial operations.
 - Built fully automated onboarding pipelines for multiple business entity types, cutting onboarding time from hours to minutes.
 - Drove observability and resilience initiatives, reducing production incidents by ~30%. Led ISO 27001 and SOC 2 Type II certifications as CIO.
-

Vice President & Sr. Engineer · [Goldman Sachs](#)

08/2020 – 07/2022

- Led a 9-engineer team owning architecture and delivery for distributed market risk aggregation systems supporting pricing, VaR, PnL, and stress testing across global risk workflows.
 - Owned and scaled multi-terabyte in-memory distributed compute clusters, improving sharding, replication, and fault tolerance — reducing failover recovery time by ~40%.
 - Optimized ingestion and processing of petabyte-scale market data for real-time analytics, cutting end-of-day batch processing time by ~25%.
 - Improved system throughput by 3x through targeted latency, concurrency, and memory-management optimizations.
 - Partnered with quants and global engineering teams on risk platform modernization initiatives; promoted to Vice President within 1 year.
-

Senior Software Development Engineer · [Moneyview](#)

07/2019 – 07/2020

- Architected and scaled payment demand generation and reconciliation systems, processing 5M+ debit instructions/month.

- Implemented idempotent retries, SLA-based scheduling, and fault-tolerant workflows, reducing manual operations by 60%.
- Integrated multiple payment gateways with resilient, high-throughput pipelines.

Senior Software Developer · Future Group

01/2019 – 07/2019

- Built a conversational AI chatbot for Easyday retail members to place, update, and cancel orders — with human handoff to store managers for complex queries, applying backend/eCommerce order-management fundamentals directly relevant to consumer commerce platforms.

Senior Software Development Engineer · Oracle

06/2016 – 01/2019

- Core developer for Oracle Identity Cloud Service (IDCS), enabling distributed identity management for enterprise cloud customers.
- Designed and delivered the SIM patch automation tool, reducing patch-related downtime by ~35% and streamlining patch management across Oracle Cloud @ Customer deployments.
- Drove PoC initiatives in automation and identity security, several of which were adopted into the product roadmap; promoted to Senior MTS within 2 years and received an Excellence Award.

KEY ACHIEVEMENTS

- Led a 12-engineer squad hands-on as a founding engineer at Skydo, staying active in code review and architecture while owning delivery, hiring, and team growth.
- Built and shipped a production agentic AI system (RAG + tool-calling) with measurable business impact — 65% auto-triage, 50% reduction in SLA breaches.
- Led ISO 27001 and SOC 2 Type II certifications as CIO, establishing org-wide security and compliance posture.
- Promoted to Vice President at Goldman Sachs within 1 year, recognizing leadership impact on large-scale distributed systems.

TECHNOLOGY STACK

Languages: Java, Python, JavaScript/TypeScript (fast ramp-up on new stacks)	Cloud: GCP (BigQuery, App Engine, Cloud Run), AWS (ECS, Lambda, SQS/SNS, EventBridge, KMS), Azure (Cosmos DB)
Frameworks: Spring Boot, GraphQL, Node.js (NestJS), REST APIs, MVC	Databases: PostgreSQL, Redis, MongoDB, DynamoDB
Distributed & Data: Kafka, Spark, Flink, Elasticsearch, Redshift, ETL, microservices	AI/Agentic: LangChain/LangGraph, RAG pipelines, pgvector, agentic coding assistants

EDUCATION

M.E., Computer Science and Engineering

Indian Institute of Science (IISc), Bangalore — 2016

Thesis: Probabilistic Routing Protocol leveraging contact duration in opportunistic networks

B.E., Computer Science and Engineering

Jadavpur University, Kolkata — 2013
